Technical Specification	<b>PSI5</b> Peripheral Sensor Interface Substandard Chassis and Safety	1 / 11
		V2.1

## 1 Introduction

1 The substandard Chassis and Safety is effective with the PSI5 Base standard V2.1 and is valid for all  
2 sensors and transceivers used in chassis and safety applications. It substantiates the base standard with  
3 application specific operation modes and frame formats.

4 As chassis and safety application, all systems measuring and controlling the motion of the vehicle (e.g.  
5 wheel speed sensors, inertial sensors for dynamic and crash vehicle motion detection, damper level  
6 sensors) including the devices for driver input (e.g. example brake pedal sensors, steering angle sensors)  
7 should be developed after this substandard. The sensor signals are classically transmitted to receivers in  
8 separated control units (e.g. brake control unit, power steering unit) or centralized control units (i.e. vehicle  
9 motion observer unit, airbag unit, integrated safety unit).

10 Compared to the former PSI5 v1.3 specification, this substandard extends the frames format from 10bit to  
11 20bit frames with CRC to address the higher precision requirements for several chassis and safety  
12 applications. A dedicated status bit ensures the signal transmission also during a sensor failure allowing a  
13 possible usage of the signal for non safety related function. Separate frame control bits allow the  
14 transmission of different signals within the dedicated time slots or within asynchronous mode. A special  
15 frame mode allows the transmission of normal 10bit data (highly packed) as for several airbag sensors.

16 For standard airbag systems the PSI5 substandard Airbag is still to be used. For future systems merging  
17 airbag and other vehicle dynamic functions, it is advisable that all airbag sensors support additionally the  
18 Chassis and Safety substandard.

19 Please be aware, that not every feature can be combined among one other. Hence it is in responsibility of  
20 the system vendor to evaluate which feature is necessary to fulfill the system requirements and assure that  
21 the combination of features is compatible.

22 The document is structured similar to the PSI5 V2.1 Base Specification Standard: Chapter 2 gives  
23 recommended operation modes, whereas Chapter 3 and 4 define details of the Sensor to ECU, or the ECU  
24 to sensor communication, respectively. Chapter 5 describes Application Layer Implementations and in  
25 Chapter 6 specific system parameters and timings for VDC applications are given.

Technical Specification	<b>PSI5</b> Peripheral Sensor Interface Substandard Chassis and Safety	2 / 11
		V2.1

## 2 Recommended Operation Modes

26 The substandard Chassis and Safety limits the possible frame length to fixed 20bit to allow a cost efficient  
27 implementation with low variations of the communication interface. There are two asynchronous  
28 transmission modes and 4 synchronous modes with a standard 500us sync period whereof two of them  
29 require a tighter sensor clock tolerance to allow a higher data rate.

Asynchronous Operation		
Mode	Sensor Data	Description
A20CRC	300/1L	min. 1 value each 300µs (incl. tolerances)
A20CRC	200/1H	min. 1 value each 200µs (incl. tolerances)
Synchronous Operation		
Bus Mode	Sensor Data	Description
P20CRC	500/1L	One message slot parallel bus / 500µs data rate
P20CRC	500/2L*	Two message slot parallel bus / 500µs data rate
P20CRC	500/2H	Two message slot parallel bus / 500µs data rate
P20CRC	500/3H*	Three message slot parallel bus / 500µs data rate

30 \*) This mode requires a tighter sensor clock tolerance as typically assumed (<5%) or dependent sensors  
31 within each time slot (so that sync detection variations and clock tolerances do not add up).

## 3 Sensor to ECU communication

32 Recommended data word length is a 20bit data word with two start bits and three CRC bits for error  
33 detection. There are two frame modes defined; one with 16bit data one status flag and 3 frame control bits.  
34 This format should be used as standard for all sensors requiring a higher precision. For mixed systems  
35 including chassis and airbag systems, there is a frame format including two 10bit data words for low  
36 precision airbag signals allowing a constant 20bit frame format and a high data rate by packing two signals  
37 into one PSI5 frame,.

High precision data frame mode:

Bits	Function	Number of bits
F[0] ... F[2]	Frame control	3
E[0]	Status	1
A[0] ... A[15]	Data Region	16

38 It is recommended to use the status bit E[0] to communicate sensor failures. Using the reserved data range  
39 of A[0...15], to communicate sensor failures, should be avoided since then signal data, which could for  
40 instance be used for safety uncritical functions, would be lost. It is recommended to use the status bit E[0] to  
41 communicate sensor failures instead of transmitting status and error messages from data range 2. In that  
42 case the signal data can still be transmitted and for instance be used for safety uncritical functions. The three

Technical Specification	<b>PSI5</b> Peripheral Sensor Interface Substandard Chassis and Safety	3 / 11
		V2.1

43 frame control bits can be used to identify the signal data if different signals are sent asynchronous or signals  
44 within one time slot of a synchronous application vary from one sync period to another (time multiplexing  
45 within different sync periods).

Low precision data frame mode  
(i.e airbag sensors)

Bits	function	Number of bits
B[0] ... B[9]	Data Region B	10
A[0] ... A[9]	Data Region A	10

46 Data region A[0..9] as well as region B[0..9] can be used to transmit two different sensor signals. Coding for  
47 each signal (including error coding and initialisation data) should be the same as defined for the standard  
48 payload region A with 10bits within the base standard. Note that this frame format cannot be used in  
49 asynchronous operation combined with the high precision data range since no frame control bits exist. Using  
50 it in synchronous operation, the time slot with this data format cannot be mixed with other high precision data  
51 frame formats and signals cannot be time multiplexed due to the same reason. Mixing low precision data  
52 frame and high precision data frames within different time slots of a synchronous transmission is well  
53 feasible.

Technical Specification	<b>PSI5</b> Peripheral Sensor Interface Substandard Chassis and Safety	4 / 11
		V2.1

## 4 ECU to Sensor (bidirectional) communication

54 ECU to Sensor communication is executed with the Tooth Gap method as defined in the base standard.  
 55 Sensor response during bidirectional communication is carried out in Data range codes RC, RD1 and RD2.  
 56 Optionally, for XLong Frames the FC, RAdr and Data Fields can be used otherwise than specified in the  
 57 Base Standard, i.e. all existing function codes may be applied, followed by the RAdr and Data Field free to  
 58 use for 16 bit data. Sensor response still has to be executed during the following three sync periods, other  
 59 response codes as RC, RD1 or RD2 are allowed.

## 5 Application Layer Implementations

### 5.1 Sensor start up an Initialization

61 Sensor identification data is sent via Data Range Initialization. The initialization phase is divided into three  
 62 phases and the data message repetition count k typically has a value of 4.

63 Figure 1 Initialization of the sensor

	Initialisation Phase I	Initialisation Phase III
Duration of initialization phases	t = 50...200 ms Typical: 100 ms	Minimum: 2 messages Maximum: 200 ms Typical: 10 values

Technical Specification	<p style="text-align: center;"><b>PSI5</b> Peripheral Sensor Interface Substandard Chassis and Safety</p>	5 / 11
		V2.1

64 **Initialization Data Content:**

65 The following definitions are made in addition to the Base Specification.

66 Mandatory definitions:

	Head	Initialization	Vendor ID	Product ID					
Data field	F1	F2		F3		F4		F5	
Data nibble	D1	D2	D3	D4	D5	D6	D7	D8	D9
	PSI5 v.	# of Datablocks	Vendor ID	Sensor type		Sensor param.			

Recommended definitions:

	Application specific						
Data field	F6						
Data nibble	D10	D11	D12	D13	D14	D15	D16
	sensor specific						

Field	Name	Parameter definition	Value
F1 (D1)	Meta Information	Protocol Description (D1) PSI5 1.3 PSI5 2.x, Data Range Initialization	0100 0110
F2 (D2, D3)	Initialization data Length Number of Data nibbles transmitted	Example: F1-F9	Example: 0010 0000
F3 (D4, D5)	Vendor ID	s. Base Specification Ch. 5.1.4	
F4 (D6, D7)  F5 (D8,D9)	Sensor Type Definition of the sensor type (acceleration, pressure, temperature, torque, force, angle, etc.)  Sensor Parameter Definition of sensor specific parameters e.g . measurement range.	Examples*: Vehicle acceleration signal Vehicle angular rate signal Tire pressure signal Steering angle signal ... If F4 = XXXX 0001 X axis high G acceleration Y axis high G acceleration Central y low G acc ... If F4 = XXXX 0010 Roll rate, 300°/s, 60Hz Yaw rate, 150°/s, 15Hz ...	XXXX 0001 XXXX 0010 XXXX 0011 XXXX 0100 ... XXXX 0001 XXXX 0010 XXXX 0011 ... XXXX 0001 XXXX 0010 ...

67 Note: each vendor (see vendor ID) is responsible to define a unique list of sensor types and for each type a  
68 set of parameters. It should be ensured that a vendor specific assignment exists which avoids mix-up of  
69 sensor signals.

Technical Specification	<b>PSI5</b> Peripheral Sensor Interface Substandard Chassis and Safety	6 / 11
		V2.1

## 6 Physical Layer - Parameter Specification and timings

### 6.1 System Parameters

This section reduces the possible options on the physical side for the ease of implementation. VDC systems are implemented in "Common Mode" as defined in the Base Specification document with the following parameter selection.

#### PSI5 Common Mode

- Supply Voltage (standard voltage);  $V_{CE, \min} = 5.5V$ ;  $V_{SS, \min} = 5.0V$
- Supply voltage (low voltage);  $V_{CE, \min} = 4,2V$ ;  $V_{SS, \min} = 4,0V$
- Sync signal sustain voltage  $V_{I2} = 3.5V$
- Internal ECU Resistance  $R_{E, \max} = 12.5\Omega$

With this selection the optional given system parameters N° 7, 9 and 11 of the "common mode" table in the PSI5 V2.1 Base Specification are excluded for VDC applications.

### 6.2 Timings

#### 6.2.1 Timing example for PSI5-P20CRC-500/1L Mode

This example is calculated with a standard sensor clock tolerance of 5%.

N°	Parameter	Symbol	Remark	min	nom	max	Unit
1	Sync signal period Maximum tolerance of sync signal period +/-1	$T_{Sync}$		495		505	$\mu s$
				$t_{Ex}^N$	$t_{Nx}^N$	$t_{Lx}^N$	
2	Slot 1 start time	$t_{xS}^1$	Related to $t_0$	44	46,5	59	$\mu s$
3	Slot 1 end time	$t_{xE}^1$	Related to $t_0$	234	246,5	269	$\mu s$

The timings also apply for universal bus mode and daisy chain bus mode.

The timings for earliest start and latest end reflect the time span for a maximum time window ("receiver view"); Sensors should be programmed with nominal start times ("sensor view").

87

Technical Specification	<b>PSI5</b> Peripheral Sensor Interface Substandard Chassis and Safety	7 / 11
		V2.1

88 6.2.2 Timing example for PSI5-P20CRC-500/2L Mode

89 This example calculates the slot timings for two independent sensors within one sync period, a sensor clock  
90 tolerance of 1.8% and a time discretization of 0.5us.

N°	Parameter	Symbol	Remark	min	nom	max	Unit
1	Sync signal period Maximum tolerance of sync signal period +/-1 %	$T_{Sync}$		495		505	$\mu s$
				$t_{Ex}^N$	$t_{Nx}^N$	$t_{Lx}^N$	
2	Slot 1 start time	$t_{xS}^1$	Related to $t_0$	44	45	56	$\mu s$
3	Slot 1 end time	$t_{xE}^1$	Related to $t_0$	240	245	259,5	$\mu s$
4	Slot 2 start time	$t_{xS}^2$	Related to $t_0$	267,5	273	288	$\mu s$
5	Slot 2 end time	$t_{xE}^2$	Related to $t_0$	464	473	492	$\mu s$

91 The timings also apply for universal bus mode and daisy chain bus mode.

92 The timings for earliest start and latest end reflect the time span for a maximum time window ("receiver  
93 view"); Sensors should be programmed with nominal start times ("sensor view").

94 6.2.3 Timing example for PSI5-P20CRC-500/2H Mode

95 This example is calculated with standard sensor clock tolerance of 5% for two independent sensors within  
96 one sync slot. Start time discretization is 0.5us.

N°	Parameter	Symbol	Remark	min	nom	max	Unit
1	Sync signal period Maximum tolerance of sync signal period +/-1 %	$T_{Sync}$		495		505	$\mu s$
				$t_{Ex}^N$	$t_{Nx}^N$	$t_{Lx}^N$	
2	Slot 1 start time	$t_{xS}^1$	Related to $t_0$	44	46,5	59	$\mu s$
3	Slot 1 end time	$t_{xE}^1$	Related to $t_0$	169,5	179	198	$\mu s$
4	Slot 2 start time	$t_{xS}^2$	Related to $t_0$	203,5	214,5	235,5	$\mu s$
5	Slot 2 end time	$t_{xE}^2$	Related to $t_0$	329	347	374,5	$\mu s$

97 The timings also apply for universal bus mode and daisy chain bus mode.

98 The timings for earliest start and latest end reflect the time span for a maximum time window ("receiver  
99 view"); Sensors should be programmed with nominal start times ("sensor view").

100

Technical Specification	<b>PSI5</b> Peripheral Sensor Interface Substandard Chassis and Safety	8 / 11
		V2.1

101 6.2.4 Timing example for PSI5-P20CRC-500/3H Mode

102 This example is calculated with enhanced sensor clock tolerance of 1.5% with the first two time slots  
103 provided by one sensor (equal and correlated clock and sync detection tolerance). Start time discretization is  
104 0.5us.

N°	Parameter	Symbol	Remark	min	nom	max	Unit
1	Sync signal period Maximum tolerance of sync signal period +/-1 %	$T_{Sync}$		495		505	$\mu s$
				$t_{Ex}^N$	$t_{Nx}^N$	$t_{Lx}^N$	
2	Slot 1 start time	$t_{xS}^1$	Related to $t_0$	44	45	56	$\mu s$
3	Slot 1 end time	$t_{xE}^1$	Related to $t_0$	174,5	177,5	190,5	$\mu s$
4	Slot 2 start time	$t_{xS}^2$	Related to $t_0$	180	183,5	196,5	$\mu s$
5	Slot 2 end time	$t_{xE}^2$	Related to $t_0$	310,5	316	331	$\mu s$
6	Slot 3 start time	$t_{xS}^3$	Related to $t_0$	336	341,5	357	$\mu s$
7	Slot 3 end time	$t_{xE}^3$	Related to $t_0$	466,5	474	491,5	$\mu s$

105 The timings also apply for universal bus mode and daisy chain bus mode.

106 The timings for earliest start and latest end reflect the time span for a maximum time window (“receiver  
107 view”); Sensors should be programmed with nominal start times (“sensor view”).

108 Note, that the slot timings of slot 1 and slot two overlap (i.e.  $t_{LE}^1 > t_{ES}^2$ ). Although the slots overlap, it is  
109 ensured that the real sensor data itself will never overlap and will always be separated by at least  $T_{GAP}$ . This  
110 is possible since both slots are used by the same sensor. A slow sensor (“A”) may sent both datagrams at a  
111 later time than a fast sensor (“B”). Figure 2 depicts both situations exemplarily. Message timing for situation  
112 “A” and “B” is possible and both are fulfilling the specification.

All rights including industrial property rights and all rights of disposal such as copying and passing to third parties reserved.

Technical Specification	<b>PSI5</b> Peripheral Sensor Interface Substandard Chassis and Safety	9 / 11
		V2.1

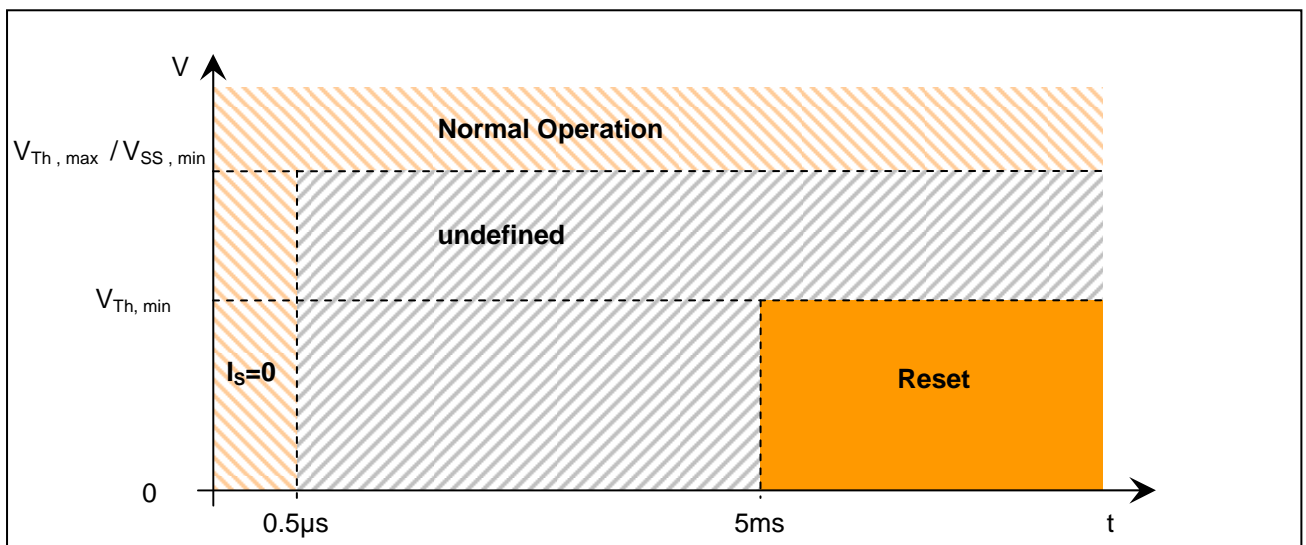

113 *Figure 2 Possible message timing for overlapping slot timings*

114 **6.3 Undervoltage Reset and Microcut Rejection**

115 The sensor must perform an internal reset if the supply voltage drops below a certain threshold for a  
 116 specified time. By applying such a voltage drop, the ECU is able to initiate a safe reset of all attached  
 117 sensors.

118 Microcuts might be caused by lose wires or connectors. Microcuts within the specified limits shall not lead to  
 119 a malfunction or degraded performance of the sensor.

*Figure 3 Undervoltage reset behaviour*

All rights including industrial property rights and all rights of disposal such as copying and passing to third parties reserved.

Technical Specification	<b>PSI5</b> Peripheral Sensor Interface Substandard Chassis and Safety	10 / 11
		V2.1

N°	Parameter	Symbol/Remark	Min	Typ	Max	Unit
1	Undervoltage reset threshold ( $V_{Th, min}$ = must reset; $V_{Th, max} = V_{SS, min}$ )	$V_{Th}$ - standard voltage mode	3		5	V
		$V_{Th}$ - low voltage mode	3		4	V
2	Time below threshold for the sensor to initiate a reset	$t_{Th}$			5	ms
3	Microcut rejection time (no sensor reset allowed) : standard	$I_S=0$	0.5			$\mu$ s

120 *Table 1 Undervoltage reset specification*

121 The voltage  $V_{Th}$  is at the pins of the sensors. In case of microcuts ( $I_S=0$ ) to a maximum duration of 0.5 $\mu$ s the  
 122 sensor must not perform a reset. If the voltage at the pins of the sensor remains above  $V_{Th}$  the sensor must  
 123 not perform a reset. If the voltage at the pins of the sensor falls below 3V for more than 5ms the sensor has  
 124 to perform a reset.

125 Different definitions may apply for Universal Bus and Daisy Chain Bus.

#### 126 **6.4 Data Transmission Parameters**
