Technical Specification	PSI5 Peripheral Sensor Specification – Substandard Airbag	Page 1 / 19
		V2.2

1           **1 Introduction**

2           The substandard Airbag is effective with the PSI5 Base standard V2.2 and is valid for all airbag components.  
3           It is in full compliance to the previous PSI5 standard PSI5 V1.3. It substantiates the base standard with the  
4           proposed operation modes and frames formats for all sensors and transceivers used in Airbag applications.

5  
6           Please be aware, that not every feature can be combined among one other. Hence it is in responsibility of the  
7           system vendor to evaluate which feature is necessary to fulfill the system requirements and assure that the  
8           combination of features is compatible.

9  
10          The document is structured similar to the PSI5 V2.2 Base Specification Standard: Chapter 2 gives  
11          recommended operation modes, whereas Chapter 3 and 4 define details of the Sensor to ECU, or the ECU  
12          to sensor communication, respectively. Chapter 5 describes Application Layer Implementations and in  
13          chapter 6 specific system parameters and timings for airbag applications are given.

All rights including industrial property rights and all rights of disposal such as copying and passing to third parties reserved.

## 2 System Setup & Operation Modes

### 2.1 System Setup

14 As specified in Base Standard.

### 2.2 Recommended Operation Modes

Asynchronous Operation		
Mode	Sensor Data	Description
A10P	250/1L	min. 1 value each 250µs (incl. tolerances)
A16CRC	500/1L	min. 1 value each 500µs (incl. tolerances)
Synchronous Operation		
Bus Mode	Sensor Data	Description
P10P	250/1L	Single sensor 4kHz data transmission
P10P	500/2L	Two message slot parallel bus / 500µs data rate
P10P	500/3L	Three message slot parallel bus / 500µs data rate
P10P	500/4H	Four message slot parallel bus / 500µs data rate
P16CRC	500/2L	Two high resolution sensors parallel bus / 500µs data rate
D10P	500/3L	Three message slot Daisy Chain bus / 500µs data rate
D10P	500/4H	Four message slot Daisy Chain bus / 500µs data rate

15 *Table 1 Recommended operation modes for airbag applications*

### 2.3 Asynchronous Mode

16 As specified in Base Standard.

Technical Specification	PSI5 Peripheral Sensor Specification – Substandard Airbag	Page 3 / 19
		V2.2

## 2.4 Synchronous Operation

### 2.4.1 Timings of Synchronous Operation

17 As specified in Base Standard.

### 2.4.2 Bus Operation Principle

18 In addition to the PSI5 base specification description, the purpose of the following recommendations is  
19 twofold:

- 20 1. To narrow down the number of different - or not compatible - Daisy-Chain implementations that could  
21 have become available through the various devices (transceivers or sensors) provided by the IC  
22 vendors.
- 23 2. To ensure that the different implementations are “fairly similar”, in order to allow application teams to  
24 integrate and/or substitute the different Daisy Chain devices into their systems with a reasonable  
25 amount of design and validation effort.

26 The different Daisy-Chain solutions can essentially be distinguished by their principle of operation -  
27 initialization sequence sent “in parallel” or sent “in series” – as well as by :

- 28 • Their capability to support one (or several) of the following communication bit rate(s) :
  - 29 ○ D10P-500/3L : 125 kb/s, 3 time slots maximum
  - 30 ○ D10P-500/4H : 189 kb/s, 4 time slots maximum
- 31 • The address encoding scheme used for the sensor response (acknowledgement for a successful  
32 address setting)
- 33 • The handling of the line switch closure by the sensor :
  - 34 ○ automatic switch closure along with the address setting (upon first sync pulse after  
35 completion of address setting) or
  - 36 ○ switch closure through dedicated bi-directional instruction (optional).

37 It is therefore recommended that future Daisy-Chain implementations comply with one of the operation  
38 modes outlined in the next 2 sub sections.

### 2.4.2.1 Preferred Daisy-Chain Mode (#1) : Parallel Initialization Phase

39 In this operation mode, each sensor sends out the initialization sequence over the previously assigned sensor  
40 time slot. The timeslot is assigned by an address setting instruction. The ECU shall assign the addresses in  
41 reverse order, i.e. that timeslot TS1 is the last one receiving its address. Furthermore, timeslot TS1 is defined  
42 as being the default timeslot for sensor error reporting in case of an unsuccessful address assignment.

#### 43 Principle of operation

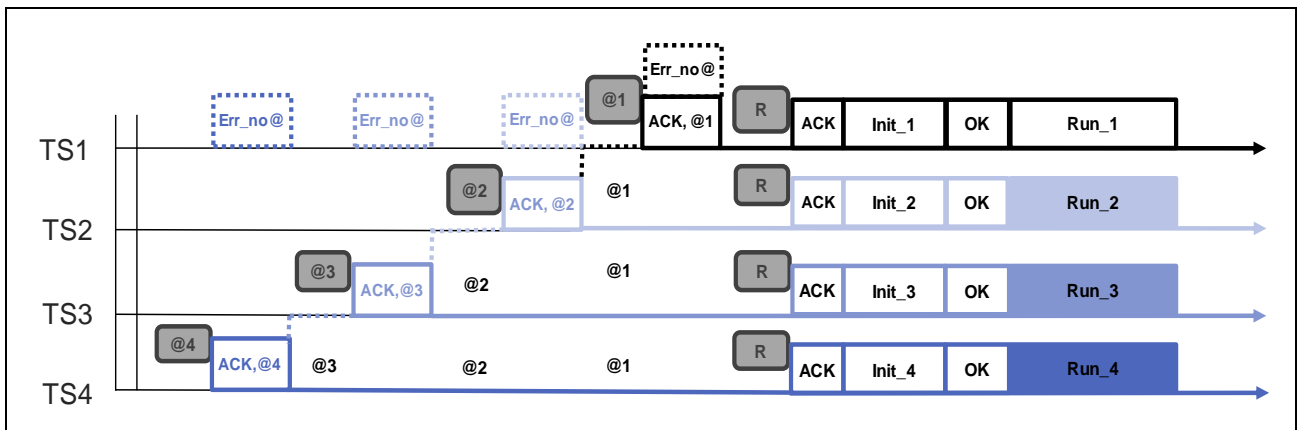

- 44 1. ECU applies supply voltage to PSI5 Interface (power on)
- 45 2. Wait for supply settling time
- 46 3. ECU assigns sensor address for time slot "TSi" to the next sensor that has not yet received its  
47 configuration
- 48 4. Addressed sensor responds by sending its internal status (acknowledge or error) message and  
49 address confirmation. Sensor closes daisy-chain switch to supply next sensor.
- 50 5. Repeat steps 2, 3 and 4 until all sensor addresses have been successfully assigned (From TS<sub>n</sub> down  
51 to TS1)
- 52 6. ECU to send RUN broadcast instruction to start runtime mode
- 53 7. All sensors to send out their initialization data within their assigned timeslot
- 54 8. All sensors to send out "sensor\_OK" messages
- 55 9. All sensors to send out their sensor data

#### 56 Bus configuration (Example with 4 time slots) :

57 Figure 1 Bus configuration for operation mode #1

#### 58 Bus timing for daisy chain mode #1 :

59 Figure 2 Bus timing for operation mode #1

2.4.2.2 *Alternative implementation (#2) : Serial Initialization-phase*

60 In this operation mode,, each sensor sends out the initialization sequence over the default sensor time slot,  
 61 right after it is powered on. The timeslot is assigned by an address setting instruction that is sent only once  
 62 the initialization sequence is over.

63 **Principle of operation**

- 64 1. ECU applies supply voltage to PSI5 Interface (power on)
- 65 2. Sensor sends out initialization sequence and “sensor\_OK” messages
- 66 3. ECU reads out complete initialization sequence and then assigns sensor address for timeslot “TSi”
- 67 4. Sensor responds by internal status (acknowledge or error) message and address confirmation. Sensor  
 68 closes daisy-chain switch to supply next sensor.
- 69 5. Repeat steps 2 to 5 until all sensor addresses have been successfully assigned.
- 70 6. ECU to send RUN broadcast instruction
- 71 7. All sensors to send out their Ack
- 72 8. All sensors to send out their sensor data

73 **Bus configuration (Example with 3 time slots) :**

74 *Figure 3 Bus configuration for operation mode #2*

75 **Bus timing for daisy chain mode #2 :**

76 *Figure 4 Bus timing for operation mode #2*

Technical Specification	<b>PSI5</b>	Page 6 / 19
	Peripheral Sensor Specification – Substandard Airbag	V2.2

### 2.4.2.3 Recommendations for Daisy-Chain application

- 77       • Daisy-Chain mode #1 (Section 8.1) is the preferred PSI5 solution and is recommended for all future  
78       circuit designs. It has some significant advantages like a shorter overall initialization duration and the  
79       possibility to assess the quality of the communication channel in the assigned slot over the whole  
80       initialization sequence (i.e. increased safety for airbag system).
- 81       • Daisy-Chain mode #2 (Section 8.2) is included here because it has already been designed into several  
82       PSI5 sensors and might therefore be used as well in some applications.
- 83       • Any further operation mode should - in principle - be avoided in order to avoid unnecessary diversity.

2.4.3       Synchronous Universal Bus Mode (PSI5-U)

2.4.4       Synchronous Daisy Chain Bus Mode (PSI5-D)

2.4.5       Sensor Cluster / Multi-channel

### 3 Sensor to ECU communication

#### 3.1 Physical Layer

84 As specified in Base Standard.

#### 3.2 Data Link Layer

85 As specified in Base Standard.

#### 3.3 Data Range

86 Basically the full data range as specified within the Base Specification can be applied too.

87 Recommended Data word length is a 10 bit data word (payload) with two start bits and one Parity bit for error  
88 detection.

89 For sensors with a data word length of more than 10 bit, the data range scales as described in the PSI5 V2.0  
90 Base Specification. Furthermore, the following definition is effective: status and initialization data words of  
91 range 2 and 3 are filled up with the value of the bit corresponding to the “D0” bit in the 10 Bit data word  
92 (possibility to check for stuck bits in the receiver).

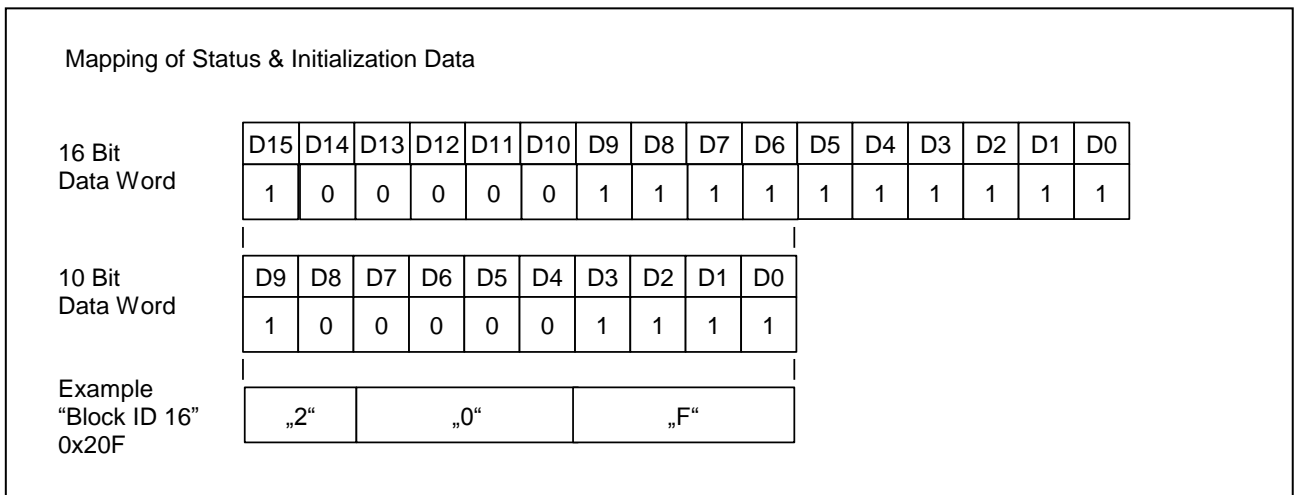

Figure 5 Mapping of status and initialization data into a data word

value		Signification	Range	
Dec	Hex			
32767	0x7FFF	Reserved (ECU internal use)	Status & Error Messages	2
+31231	0x79FF	Sensor Ready		
:	:			
+30720	0x7800	Maximum Sensor Data Value	Sensor Output Signal	1
:	:	:		
0	0x0000			
:	:	:		
-30720	0x8800	Minimum Sensor Data Value		
-30721	0x87FF	Status Data 1111	Block ID's and Data for Initialisation	3
:	:	:		
-31744	0x8400	Status Data 0000		
-31745	0x83FF	Block ID 16		
:	:	:		
-32768	0x8000	Block ID 1		

93 Table 2 Scaling example: Data Range for a 16 Bit data frame

Technical Specification	<b>PSI5</b>	Page 9 / 19
	Peripheral Sensor Specification – Substandard Airbag	V2.2

#### 4 ECU to Sensor communication

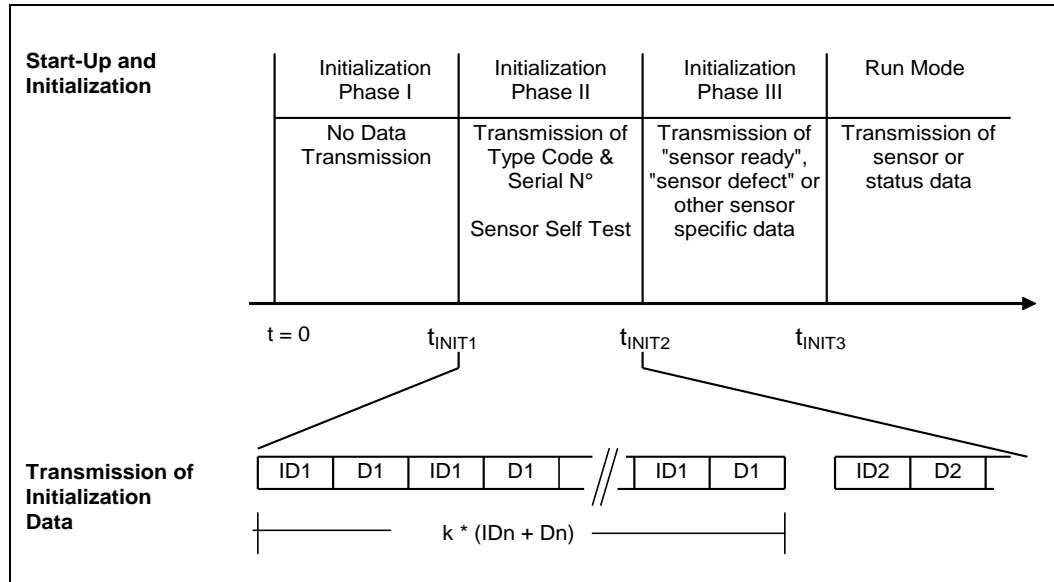

- 94 ECU to Sensor preferred communication (for legacy reasons) is executed in Tooth gap mode as defined in  
95 the base standard. Sensor response during bidirectional communication is carried out in Data range codes  
96 RC, RD1 and RD2.

## 5 Application Layer Implementations

### 5.1 Sensor Initialization / Identification

#### 5.1.1 Frame Format - Data Range Initialization

97 The initialization phase is divided into three phases:

98 *Figure 6 Initialization phases of the sensor*

	Initialisation Phase I	Initialization Phase II	Initialisation Phase III
Duration of initialization phases	$t = 50 \dots 150$ ms Typical: 100 ms	Minimum: see §5.1.2 Maximum: see Note 3	Minimum: 2 messages Maximum: 200 ms Typical: 10 values

99 *Figure 7 Duration of the initialization phases*

100 Note 1: During Initialization Phase I, there is no data transmission, but sync pulses may be sent or not.  
101 Sensor shall be compliant with Sync pulses in phase I.

102 Note 2: During Initialization phase II, Sensor identification data is sent via Data Range 3 and the data  
103 message repetition count  $k$  has typically a value of 4. In case of exception or failure mode, information coded  
104 in data range 2 may be sent in place of sensor identification.

105 Note 3: If at the end of Initialization Phase II, the sensor has not finished its internal self-test, Initialization  
106 Phase II is extended and sensor can send "SENSOR\_BUSY" (Initialization Phase IIb)

#### 5.1.2 Initialization Data Content in Phase II:

107 The section §5.1.2 of the *Base Standard* defined the mandatory Initialization Data Content and definitions.

108 Note : For compatibility reasons with legacy airbag applications, the field F1 (D1) should refer to PSI5 ver 1.3,  
109 value = '0100'. For upcoming sensors - compliant with PSI5 ver 2.x - it is recommended to have the F1 (D1)  
110 value configurable to either '0110' or '0100' depending on application needs.

111 The following definitions are made in addition to the Base Specification.

Recommended definitions:

Application specific												
Data field	F6		F7			F8				F9		
Data nibble	D10	D11	D12	D13	D14	D15	D16	D17	D18	D19	...	D32
	Sensor manuf.		Sensor application			Sensor production date				Sensor trace inf.		

Field	Name	Parameter definition	Value
F6 (D10,D11)	Sensor Code (Sensor manufacturer) Definition of sensor specific parameters or additional information.	To be specified by the sensor manufacturer.	Sensor specific definition
F7 (D12-D14)	Sensor Code (Sensor application)	Usage e.g. for product revision information.	Sensor specific definition
F8 (D15-D18)	Sensor Production Date Production date of the sensor.	Binary coded julian date: Year: 00-99 (7 bit value) Month: 01-12 (4 bit value) Day: 01-31 (5 bit value)	Example: 2006: 0000110 March: 0011 30: 11110
F9 (D19-D32)	Sensor Trace information E.g. production lot / line / serial number	To be specified by the sensor manufacturer	Sensor specific definition

112 *Table 3 Initialization data content in Phase II*

### 5.1.3 Initialization Data Content in Phase III:

113 The purpose of the following recommendations is twofold:

- 114 1. To narrow down the number of different - or not compatible - implementations that could have become
- 115 available through the various sensors provided by different vendors.
- 116 2. To ensure that the different implementations are “fairly similar”, in order to allow application teams to
- 117 integrate and/or substitute the different PSI5 devices into their systems with a reasonable amount of
- 118 design and validation effort.

119 The existing solutions vary significantly with respect of the sensor type, as can be seen in the below given

120 description.

#### 121 a) Acceleration sensors

122 Existing Implementations are all working after the same principle:

123 Sending “sensor ready” in various repetitions under standard conditions, whereas in case of an error

124 a sequence of various numbers of “sensor defect” is sent followed by an endless repetition of “sensor

125 defect” and the corresponding error code until the power supply is switched off.

#### 126 b) Pressure sensors

127 Pressure Sensors not only send “sensor ready” or “sensor defect” + error code during initialization

128 phase III, but also specific sensor status data, as e.g. absolute pressure, or temperature. (All status

129 data from data range 2 or 3,)

130 The existing solutions cannot be narrowed down to a common minimum principle, which makes integration of  
 131 different devices complicated. Hence, it is recommended that future implementations for pressure sensors  
 132 comply with the minimum definition outlined below.

- 133 • At minimum one “SENSOR READY” (or “SENSOR DEFECT”) is sent at the beginning of Initialization Phase  
 134 III.
- 135 • Several informations may be sent during Initialization Phase III such as "Absolute pressure", "Sensor  
 136 temp" or "sensor self diag". These informations are coded in data range 2 and 3
- 137 • Initialization Phase III ends with the first sensor measurement data word sent out of data range 1.

138

139

Phase 3		Phase 3 message sequence standard conditions	
time (ms)	#		
0,5	1	Start	sensor ready
1	2	.	.
1,5	3	.	.
2	4	.	.
.	.	.	.
.	.	.	.
.	.	.	.
N	n		sensor ready
.	.	.	.
.	.	.	.
max 200	max 400	End	.
End of Phase 3			
200,5	1	Start of normal operation	Sensor output signal (Data range 1)

- 140 • In error state an endless repetition of “sensor defect” and the corresponding error code follows the first  
141 status message(s) until the power supply is switched off.

Phase 3		Phase 3 message sequence error conditions	
time (ms)	#	continuosly	
0,5	1	Start	sensor defect
1	2		sensor defect
1,5	3		.
2	4		.
.	.		sensor defect
.	.		err code
.	.		sensor defect
.	.		err code
.	.		sensor defect
.	.		err code
.	.	End	... till power down

## 5.2 Bidirectional Communication

### 5.2.1 Sensor Addresses

142 Accordingly of sections §4.2 and §5.2 of the base specification, the instruction codes to be used in case of  
143 Daisy Chain implementation are:

#### ECU to sensor (short instructions) :

144  
145 [ @1 ] = 0x28CE            Set address #1  
146 [ @2 ] = 0x28AF            Set address #2  
147 [ @3 ] = 0x28E8            Set address #3  
148 [ @4 ] = 0x289A            Set address #4  
149 [ R ] = 0x2F8F            Run

#### Sensor to ECU :

150 Err\_no@ : Sensor error code when address assignment was not successful  
151 Sensor address = RD1 = encoded values from data range 3 (e.g. @1 = 0x211, @2 = 0x212, @3 =  
152 0x213, @4 = 0x214)

154 Note : following messages are used in the drawings, but are not specific to daisy chain applications

155 Ack = RC = 0x1E1 (or Err = 0x1E2)

156 OK = 0x1E7

Technical Specification	<b>PSI5</b>	Page 14 / 19
	Peripheral Sensor Specification – Substandard Airbag	V2.2

## 6 Physical Layer - Parameter Specification

### 6.1 General Parameters

#### 6.1.1 Absolute Maximum Ratings

157 As specified in Base Standard.

#### 6.1.2 System Parameters

158 For Airbag systems, it is recommended to use the “Common Mode” with the following selected parameters.

#### 159 PSI5 Common Mode

- 160 ■ Supply Voltage (standard mode);  $V_{CE, \min} = 5.5V$ ;  $V_{SS, \min} = 5.0V$
- 161 ■ Supply Voltage (increased mode);  $V_{CE, \min} = 6.5V$ ;  $V_{SS, \min} = 5.0V$
- 162 ■ Sync signal sustain voltage  $V_{t2} = 3.5V$
- 163 ■ Internal ECU Resistance  $R_{E, \max} = 12.5\Omega$

## 6.2 Sensor Power-on Characteristics

### 6.2.1 Sensor Bus Configuration

164 To ensure a proper startup of the system, the maximum startup time  $t_{SET1}$  is specified. During this time, the  
 165 ECU must provide a minimum current to load capacitances in sensors and wires. After this time, the sensor  
 166 must sink to quiescent current within the specified tolerance band.

167 *Figure 8 Current consumption during startup*

N°	Parameter	Symbol/Remark	Min	Typ	Max	Unit
1	Settling time for quiescent current $I_{LOW}$	$t_{SET1}$			5.0	ms
2*	Settling time for quiescent current $I_{LOW}$ (Daisy Chain Bus)	$t_{SET}$ , Daisy Chain Bus			10.0	ms

168 1\*) Final value settles to  $\Delta I_{Low} = +/-2mA$  (common mode) with respect to  $I_{LOW}$  according to the defined  
 169 signal noise limit

170 2\*) Mandatory settling time for quiescent current in Daisy Chain Bus. The Bus does not sink a current  
 171 over  $I_{LIMIT,dynamic}$  at any time.

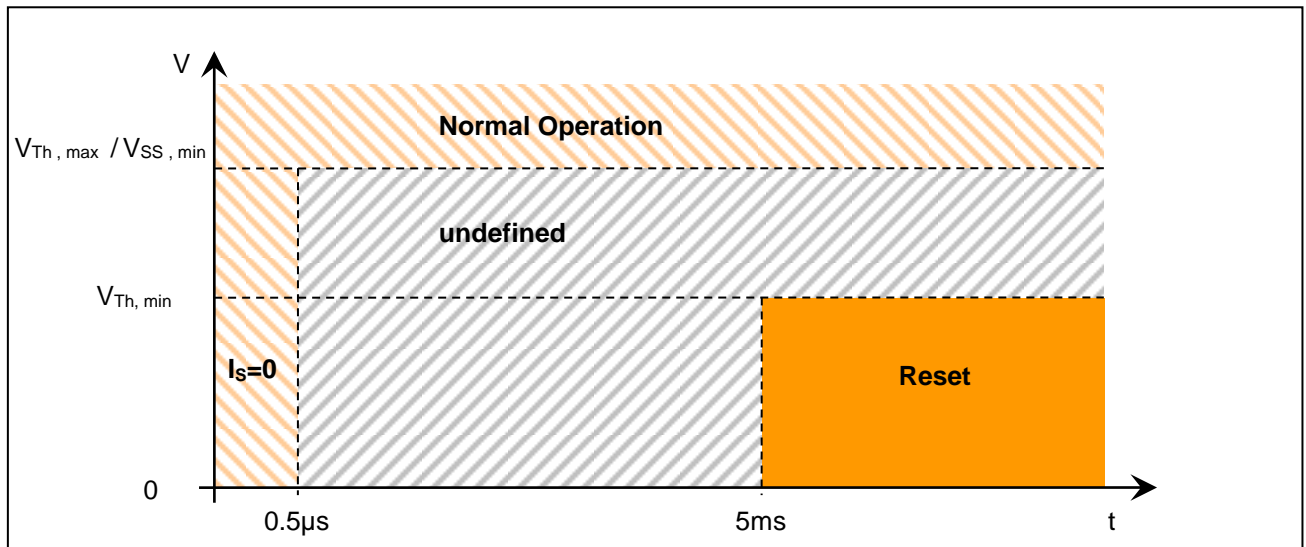

### 6.2.2 Extended Settling Time for Single Sensor Configuration

172 An extended settling time  $t_{SET2}$  is not allowed.

### 6.3 Undervoltage Reset and Microcut Rejection

173 The sensor must perform an internal reset if the supply voltage drops below a certain threshold for a  
 174 specified time. By applying such a voltage drop, the ECU is able to initiate a safe reset of all attached  
 175 sensors.

176 Microcuts might be caused by lose wires or connectors. Microcuts within the specified limits shall not lead to  
 177 a malfunction or degraded performance of the sensor.

178 *Figure 9 Undervoltage reset behaviour*

N°	Parameter	Symbol/Remark	Min	Typ	Max	Unit
1	Undervoltage reset threshold ( $V_{Th, min}$ = must reset; $V_{Th, max}$ = $V_{SS, min}$ )	$V_{Th}$ - standard voltage mode	3		5	V
2	Time below threshold for the sensor to initiate a reset	$t_{th}$			5	ms
3	Microcut rejection time (no sensor reset allowed) : standard	$I_s=0$	0.5			$\mu s$
4*	Microcut rejection time (no sensor reset allowed) : optional	$I_s=0$ Applicable test conditions for this specification : micro-cuts of 10 $\mu s$ , applied every 1 ms for a total duration of 4 s	10			$\mu s$

179 *Table 4 Undervoltage reset specification*

180 4\*) Note: as the micro-cut duration of 10  $\mu s$  exceeds the transmission bit time, data frame [or sync pulse]  
 181 corruption might occur when the micro-cut is applied. So it cannot be guaranteed that all data frames  
 182 are successfully transmitted, but a reset of the sensor (with a complete initialization sequence sent  
 183 out) is not allowed.

184 The voltage  $V_{Th}$  is at the pins of the sensors. In case of microcuts ( $I_s=0$ ) to a maximum duration of 0.5 $\mu s$   
 185 (Optional 10  $\mu s$ ) the sensor must not perform a reset. If the voltage at the pins of the sensor remains above

186 V<sub>TH</sub> the sensor must not perform a reset. If the voltage at the pins of the sensor falls below 3V for more than  
187 5ms the sensor has to perform a reset.  
188 Different definitions may apply for Universal Bus and Daisy Chain Bus.

#### 6.4 Data Transmission Parameters

189 All parameters defined in base specification §6.4 are valid for Airbag Applications with the following  
190 exception:

N°	Parameter	Symbol/Remark	Min	Typ	Max	Unit
3*	Sensor clock deviation during data frame				0.1	%

191 *Table 5 Data transmission parameters for airbag applications*

192 3\*) @ maximum temperature gradient and maximum frame length. Value limited to 0.1% due to  
193 compliance with legacy receiver and reduction of signal to noise ratio

#### 6.5 Synchronization Signal

194 As specified in Base Standard.

#### 6.6 Timing Definitions for Synchronous Operation Modes

##### 6.6.1 Generic Time Slot Calculation

195 Please note that due to backward compatibility the values given below are adopted from PSI5 V1.3.  
196 Derivations to calculated timeslots according to Ch. 6.6 in the PSI5 V2.0 Base Standard are possible.

##### 6.6.2 PSI5-P10P-500/3L Mode

197 This example is calculated with a standard sensor clock tolerance of 5%.

N°	Parameter	Symbol	Remark	min	nom	max	Unit
1	Sync signal period Maximum tolerance of sync signal period +/-1	T <sub>Sync</sub>		495		505	µs
				t <sup>N</sup> <sub>Ex</sub>	t <sup>N</sup> <sub>Nx</sub>	t <sup>N</sup> <sub>Lx</sub>	
2	Slot 1 start time	t <sup>1</sup> <sub>xS</sub>	Related to t <sub>0</sub>	44			µs
3	Slot 1 end time	t <sup>1</sup> <sub>xE</sub>	Related to t <sub>0</sub>				µs
4	Slot 2 start time	t <sup>2</sup> <sub>xS</sub>	Related to t <sub>0</sub>	181.3			µs
5	Slot 2 end time	t <sup>2</sup> <sub>xE</sub>	Related to t <sub>0</sub>				µs
6	Slot 3 start time	t <sup>3</sup> <sub>xS</sub>	Related to t <sub>0</sub>	328.9			µs
7	Slot 3 end time	t <sup>3</sup> <sub>xE</sub>	Related to t <sub>0</sub>			492	µs

198 *Table 6 PSI5-P10P-500/3L timeslots specification*

199 The timings also apply for universal bus mode and daisy chain bus mode.

### 6.6.3 PSI5-P10P-500/4H Mode

200 This example is calculated with a standard sensor clock tolerance of 5%.

N°	Parameter	Symbol	Remark	min	nom	max	Unit
1	Sync signal period Maximum tolerance of sync signal period +/-1	$T_{Sync}$		495		505	$\mu s$
				$t^{N_{Ex}}$	$t^{N_{Nx}}$	$t^{N_{Lx}}$	
2	Slot 1 start time	$t^1_{xS}$	Related to $t_0$	44			$\mu s$
3	Slot 1 end time	$t^1_{xE}$	Related to $t_0$				$\mu s$
4	Slot 2 start time	$t^2_{xS}$	Related to $t_0$	139.5			$\mu s$
5	Slot 2 end time	$t^2_{xE}$	Related to $t_0$				$\mu s$
6	Slot 3 start time	$t^3_{xS}$	Related to $t_0$	245.5			$\mu s$
7	Slot 3 end time	$t^3_{xE}$	Related to $t_0$				$\mu s$
8	Slot 4 start time	$t^4_{xS}$	Related to $t_0$	362.5			$\mu s$
9	Slot 4 end time	$t^4_{xE}$	Related to $t_0$			492	$\mu s$

201 *Table 7 PSI5-P10P-500/4H timeslots specification*

202 The timings also apply for universal bus mode and daisy chain bus mode.

## 7 Document History & Modifications

Rev.N°	Chapter	Description / Changes	Date
2.0	all	<ul style="list-style-type: none"> <li>First Release of Airbag Substandard;</li> <li>Revision Number of corresponding PSI5 Base Document adopted</li> </ul>	01.06.2011
2.1	2	<ul style="list-style-type: none"> <li>Add Daisy Chain modes in table of section 2 (Recommended operation modes)</li> <li>Add chapter 2.1, on guidelines for implementation of daisy chain operation modes</li> </ul>	22.08.2012
2.1	1	<ul style="list-style-type: none"> <li>Editorial Changes</li> </ul>	11.09.2012
	3	<ul style="list-style-type: none"> <li>Single decimal codes in table 1 corrected</li> </ul>	
	5.1	<ul style="list-style-type: none"> <li>new</li> </ul>	
	6.3	<ul style="list-style-type: none"> <li>new</li> </ul>	
2.1	2.1	<ul style="list-style-type: none"> <li>Add switch closure time (1<sup>st</sup> sync pulse after address setting)</li> <li>switch closure through dedicated bi-directional instruction =&gt; optional</li> </ul>	18.09.2012
2.1	all	<ul style="list-style-type: none"> <li>Some minor changes : add captions for figures and tables</li> </ul>	02.10.2012
	3.1	<ul style="list-style-type: none"> <li>Signal amplitude "0" =&gt; If symmetrical sensor scale</li> </ul>	
	2	<ul style="list-style-type: none"> <li>A8P mode has been deleted from table 1 . PSI5 covers only 10bit+ data sizes</li> </ul>	
	3.1	<ul style="list-style-type: none"> <li>Removed : Signal amplitude "0" for 0x0000 value in table 2</li> </ul>	
	5.1	<ul style="list-style-type: none"> <li>Add note for clarification of the list of messages from sensor to ECU : ACK &amp; OK not specific to daisy chain mode</li> </ul>	
	5.2	<ul style="list-style-type: none"> <li>Changed 'ver 2.0' to 'ver 2.x' in footnote of table 3, as note is applicable for all upcoming versions</li> </ul>	
	6	<ul style="list-style-type: none"> <li>Add footnote to table 6 for clarification of sensor reset behavior when micro-cuts are applied</li> </ul>	
	6.1	<ul style="list-style-type: none"> <li>Add increased voltage mode for daisy chain applications : <math>V_{CE\ min} = 6.5\ V</math></li> </ul>	
	6.4	<ul style="list-style-type: none"> <li>Add section 6.4 : Data Transmission Parameters</li> <li>Add Sensor clock deviation during data frame : 0.1 % max (Table 7)</li> </ul>	
2.2	5.2	<ul style="list-style-type: none"> <li>Renamed Ch. 5.2 in Sensor start up and Initialization</li> </ul>	31.10.2013
